Kanvaz

The Reference Operating System.

v9.8.3

WHAT IS THIS?

Kanvaz is a free, offline infinite canvas for VFX, 3D and game artists. Drop in images, GIFs, video, audio, 3D models and PDFs, arrange them freely, draw directly on top, link related references together, and keep everything in one portable .kanvaz file. Built for breakdowns, mood boards, shot references, and anything you'd normally pin to a wall.

WHO MADE THIS

Made by Atharva Patil | P4inz | P4inz Interactive Labs, Navi Mumbai, India. Kanvaz started as a personal tool for organizing VFX references and is now free, open-source (MIT) software, kept small and developed on real feedback.

KEY FEATURES

- **Infinite canvas**
  Pan and zoom freely, 8% to 500%. Arrange hundreds of references with no fixed boundaries.
- **Drop in anything**
  Images, GIFs, video, audio, 3D models, PDFs, and Adobe or HDR files land right on the canvas. Drag them in from your file explorer or paste an image with Ctrl+V.
- **Live 3D preview**
  Orbit .glb, .gltf, .obj, .fbx and more right on the board, with 13 render modes such as wireframe and matcap, plus animation playback.
- **Annotate anything**
  Draw on any card with pen, highlighter, line, arrow, rectangle, ellipse, text, a pixel-measure tool and a color eyedropper.
- **Connections & Map View**
  Link references with 7 kinds of typed relationship, then press M to see the whole web as a node graph.
- **One portable file**
  Everything (boards, positions, annotations, zoom) saves to a single .kanvaz file and restores exactly. Multiple boards per file.
- **Themes & Top Mode**
  Press L to switch between dark and light. Ctrl+Shift+T keeps Kanvaz on top; Ctrl+Shift+L (MoodLock) isolates the selection and hides every toolbar, leaving just the reference.

PRIVACY & OFFLINE

Kanvaz runs entirely on your machine. No accounts, no telemetry, no analytics, and no internet connection required. Your boards and media never leave your computer unless you share the file yourself. The only network requests are ones you start with a click: Check for updates, Browse Official Plugins, Browse community templates, and a URL card's Fetch preview.

Free & open source. Yours to keep.

Kanvaz

Quick Start Guide

GETTING STARTED

1. **Install and open**
   Download the installer for your OS from the latest GitHub release. No account needed. Kanvaz is unsigned, so Windows may say "Windows protected your PC" (More info, then Run anyway); on macOS right-click the app and choose Open the first time.
2. **Start a board**
   On the Home Screen choose New Board, Open from computer, or one of 14 starter templates (Filmmaking, Game Art, Mood Board, VFX, and more).
3. **Add your media**
   Drag files from your file explorer onto the canvas, paste an image with Ctrl+V, or right-click and choose Add for a note, color swatch or URL.
4. **Move, resize & annotate**
   Drag a card to move it and drag its handles to resize (hold Shift to lock proportions). Select a card and press A, or right-click and choose Annotate, to draw on it.
5. **Boards & saving**
   The Boards section in the left rail creates, switches and renames boards; each keeps its own cards and view. Ctrl+S saves a .kanvaz file and Ctrl+Shift+S saves a copy. Autosave every 30 seconds is only a crash-recovery safety net, so save with Ctrl+S.

TOP 5 SHORTCUTS

`Space + Drag`	Pan around the canvas	`Scroll`	Zoom in / out
`Ctrl + S`	Save the current board	`Ctrl + K`	Command Palette
`Ctrl + Z`	Undo (up to 50 steps)		

Press ? anywhere in Kanvaz for the full, searchable shortcut list.

PRO TIPS

- **Pin cards in place**
  Select a card and press P (or right-click, then Pin) to lock its position so it can't be moved or nudged by accident.
- **Duplicate with Ctrl+D**
  Quickly clone the selected card. Handy for creating variations or side-by-side comparisons.
- **Toggle annotations with H**
  Select an annotated card and press H to hide or show your marks without deleting them.
